

CHECKLIST				
#	SUBJECT	CHECKPOINTS	Reviewed?	Comments
1	Test Case Description	Description should be unique and explain the test case and Inputs/Outputs. Describe the scenario covered for that requirement. 1- Should not use the direct L2R text in the test description 2- First part of the Description should clearly explain the test case objective	Yes	
2	Test Scripts Check	Auto review Py scripts check was executed without any major findings For fully automation scripts suffix the script name with _A When adding a manual test case to a fully automated script, split the new script and suffix it with _M, this way the full Automations script can continue to be run in batch execution	Yes	
3	Number of identified test cases	Are all test cases identified? If test case identified is more than 10 for a complex L2Rs or >6 for a med/minor. Is the test case count justified? Are some of those cases were covered by another L2R. Can there be an optimization technique that be applied? 1- Non-scorable test - Should not write more than 2 and identified test cases could be clubbed together when there are more than 2 2- Test technique - All the industry standard used technique were listed. Pls apply appropriately to the identified test cases. Test cases for Boundary Value Analysis and Equivalence Partitioning should be included in the datasheet. 3- Appropriate Negative test case to be created. Are some of those negative cases were covered by another L2R? if yes, then create non-scorable test in that case.	Yes	
4	TBC functional testing	L2Rs deals with TBC values. If the TBC variations is covered in 1 L2R values. 1- Every TBC variation tests must exercise the functional behavior of the requirement at least once for a L2R. Ex. TB137 must test for the range with restricted speed targets and enforcement. 2- Additionally TBC Range check executed to cover the ranges for a release (optional). Out of range TBC values are covered in Automation script, hence we need not to add test cases for out of range values.	Yes	
5	Interoperability	Multi RR, various tracks, train positioning, route change also needs to be included to cover enhanced scenarios.	Yes	
6	Track Version, Control System and other dependencies	Are there any dependencies on testing the L2R? e.g. New track file, Control system, Simulator, track editor etc. If any of the dependencies are not available, have we added a place holder test case and marked L2R testing incomplete to be revisited when the required dependencies are made available?	Yes	
7	ICDs and Data dictionaries	Are there any Data Dictionaries, Sensor Management, ICDs impacted by the new features tested in the L2Rs and have we covered any test cases around those changes?	Yes	
8	Integrated systems	If there is any messaging between another system component e.g. CHM, EM, HOT, BAM. Is that following the correct version of ICDs, message headers, message versions, etc.?	Yes	
9	License features	Assessing impact of License features functionality on base requirements when applicable. Ex. Targets, Prompts	Yes	
10	Location/Direction Selection	Combination of various Train orientation considering REVERSER handle FWD/REV, Locomotive orientation Front/Back needs to covered	Yes	
11	Triplex Scenarios	If a new functionality is added, is there any testing around Triplex scenarios for primary reboots, flip and failed scenarios needs to be considered?	Yes	
12	Test Case Review Comments	Has a Formal Review carried out and are the review comments logged in 1st Test Script of the L2R in RQM?	Yes
